

Title: Plastic Rolling Platform

Claim II

What I claim as my invention is the "Plastic Rolling Platform" for the rolling transport of mailing materials.

Description: The plastic rolling platform is the same shape as the removable shelf minus the eleven open slots on one side. The platform is 2 inches thick. On the top of the platform are eleven 1 inch deep elongated grooves. The deep grooves are to anchor the assembled removable shelf and divider frame inside the platform for a tight secure fit. Also on the top of the platform are four holes two on each side for the placement of the long detachable handles.

On the bottom of the platform are four rolling casters. Two rigid. Two swivel. On the sides of the platform are mounting holes for the manual and coupling to another plastic rolling platform. The platform can also be powered pull by a postal "mule".

Thank you
